

Small operators can show the work, but cannot spec the software.

Admissions teams already run the process every day. The gap is turning that visible work into a usable internal tool.

Manual admissions loop

-  **WhatsApp inquiry** Lead asks course, fee, batch, timing.
-  **Spreadsheet row** Admin copies name, phone, status, notes.
-  **Fee + follow-up** Payment and next message tracked by memory.
-  **Repeated messages** Same replies are typed or pasted again.

Pain point

The work is real, repetitive, and valuable, but it lives across chats, sheets, memory, and copy-paste.

Most small teams will never write a PRD. They can record their screen.

software specs written

WorkTape makes the recording the software spec.

Users upload a workflow recording. WorkTape extracts the process, asks only the missing questions, then renders the internal tool from the resulting spec.

MVP key features

Upload recording, extracted workflow, detected objects and fields, clarifying questions, JSON spec, and a usable generated CRM.

Not a generic builder

The product starts from observed human work, not a blank prompt or template gallery.

Real AI backend, spec-driven app, honest fallback.

The MVP optimizes for one reliable proof: an uploaded recording is converted into a structured spec, and the CRM renders from that spec.

■	Next.js UI	Upload, progress, extracted workflow, questions, generated tool
■	API backend	Receives video, runs ffmpeg, extracts frames
■	OpenAI vision	Responses API, gpt-5.5, reasoning high, structured JSON
■	WorkflowSpec	Objects, fields, statuses, actions, templates, screens
■	Spec renderer	Forms, table, statuses, templates, CSV export

DEMO DISCIPLINE

Fallback sample is labeled. It protects the demo, not the product claim.

No WhatsApp API claim in Phase 1.
Messages are templates with copy-to-clipboard.

Deploy path

Local Next.js app exposed through Cloudflare Tunnel for the live demo

Start with coaching institutes, then expand across repeated admin work.

The wedge is narrow by design: admissions teams who already manage leads through WhatsApp and spreadsheets.

FIRST ICP

Coaching institute admissions admins

They handle high-volume inquiries, repeated fee/batch questions, manual follow-ups, and spreadsheet status tracking.

Expansion rule

Only expand when the workflow has the same shape: repeated intake, status tracking, follow-up, and export.

Clinics

patient intake +
appointment follow-up

Local services

inquiry + estimate + job
status

Freelancers

client lead + project
tracker

Why this wedge wins

The user does not need to explain the app. They only need to show the work once.
